Teaching

CS4459: Cyber Attack and Defense Laboratory (CANDL)

UNIVERSITY OF TEXAS AT DALLAS

Dallas, TX

Spring 2023 - 2021

The CANDL is a hands-on security lab course that teaches a broad range of offensive and defensive techniques for computer systems. Specifically, the course consists of eight units featuring hands-on labs in a CTF format in binary reversing and pwning techniques, covering topics from introductory (e.g., stack overflow, shellcode) and intermediate levels (e.g., ROP, format string vulnerabilities) and advanced topics (e.g., heap exploits). The course also covers vulnerability analysis, exploit development, patching vulnerabilities, bug hunting etc.

CS4301: Cyber Attack and Defense Laboratory (CANDL)

Dallas, TX

UNIVERSITY OF TEXAS AT DALLAS

Spring 2021 - 2023

First launched in Spring 2021 as a 3-credit hour, special topic course, the CS4301 has attracted many undergraduates over three years. The course teaches offensive and defensive techniques for computer systems, covering introductory to intermediate binary reversing and exploitation techniques, including vulnerability analysis, exploit development, and bug hunting. It features eight units of hands-on labs with CTF-style challenges. Starting Spring 2024, we will expand this hands-on binary reversing and hacking course, incorporating CTF challenges, to a four-credit hour, security elective (CS4459).

CS6332: System Security and Binary Code Analysis

Dallas, TX

UNIVERSITY OF TEXAS AT DALLAS

Fall 2019 - present

The CS6332, a graduate-level system security course, focuses on the fundamental principles of recent system security research, emphasizing the software execution stack in various system architectures, including desktops, servers, and IoT devices. It examines the impact of system characteristics on security across hardware architectures like x86, AMD64, and ARM, and discusses securing software execution layers, such as code generation pipelines, process-level virtualization, and container environments. The course also tackles the challenges of code generation, deployment, and reversing, especially regarding dynamic language interpreters.

CS7301: Advanced topics in System Security

Dallas, TX

UNIVERSITY OF TEXAS AT DALLAS

Spring 2020

The graduate-level, special-topic course comprises three parts. The first offers a historical and principled overview of notable attacks and their defenses, reviewing key static and dynamic techniques used in defense strategies. The second part explores cutting-edge topics in system security research, covering provenance analysis, the Internet of Things (IoT), and Industrial Control Systems/Cyber-Physical Systems (ICS/CPS), to understand and extend traditional methods to new challenges. Finally, we examine machine learning's role in solving modern system security problems.

Introduction to Programming (COMSW3101-003)

NY, New York

COLUMBIA UNIVERSITY

Fall 2013

Designed and taught a course, Programming with Python as a graduate research assistant (Enrollment: 14, rating 4.5/5.0)
